

Cluster-forming $t > 2.39$ ($p < .01$) · cluster-extent FWE $p < .05$

model2 · $n = 58$ · surviving extent, % of mask: RPE +65.9 / -0.0 uRPE +2.2 / -30.3 Surprise +1.1 / -0.0

model2 — the GLM the paper reports: choice (surprise, value), feedback (signed RPE only). It has no uRPE regressor at all, so the uRPE rows and maps here come from model7, exactly as the manuscript mixes them. Its RPE is the full effect, not a residual.

Cluster-forming $t > 2.39$ ($p < .01$) · cluster-extent FWE $p < .05$

model2 · $n = 58$ · surviving extent, % of mask: RPE +65.9 / -0.0 uRPE +2.2 / -30.3 Surprise +1.1 / -0.0

model2 — the GLM the paper reports: choice (surprise, value), feedback (signed RPE only). It has no uRPE regressor at all, so the uRPE rows and maps here come from model7, exactly as the manuscript mixes them. Its RPE is the full effect, not a residual.

b Axial sections

Same cuts in every row, so extent can be compared straight down a column. Rows are the six maps on their own; the last row is all of them together.

Cluster-forming $t > 2.39$ ($p < .01$) · cluster-extent FWE $p < .05$

model2 · $n = 58$ · surviving extent, % of mask: RPE +65.9 / -0.0 uRPE +2.2 / -30.3 Surprise +1.1 / -0.0

model2 — the GLM the paper reports: choice (surprise, value), feedback (signed RPE only). It has no uRPE regressor at all, so the uRPE rows and maps here come from model7, exactly as the manuscript mixes them. Its RPE is the full effect, not a residual.

c Coronal sections

Same cuts in every row, so extent can be compared straight down a column. Rows are the six maps on their own; the last row is all of them together.

Cluster-forming $t > 2.39$ ($p < .01$) · cluster-extent FWE $p < .05$

model2 · $n = 58$ · surviving extent, % of mask: RPE +65.9 / -0.0 uRPE +2.2 / -30.3 Surprise +1.1 / -0.0

d Which contrasts claim each piece of tissue

A voxel's category is the set of contrasts that call it significant, so "only" means no other contrast claims it. The remaining 3 combinations hold 189 voxels and are charted but not mapped.
